

Business Profile

Colorado Lining International, Inc. was founded in 1978, in Parker, Colorado and is a certified fabricator and installer of quality geomembranes. Colorado Lining has been family owned and operated and has grown from a small 4 person fabrication crew to becoming an industry leader in solving complicated containment issues with turn-key geosynthetic services for many industries, including the Oil & Gas industry. The company has over 3 decades of service and has fabricated and installed more than 800 million square feet of geomembranes and specialty materials.

CLI'S OIL & GAS CONTAINMENT OFFERINGS

POND, PIT AND IMPOUNDMENT LINERS

Proper engineering and construction of lining systems used in the containment of production water generated by horizontal drilling and hydraulic fracturing processes is a critical issue for the future of oil and gas production. The Federal and State governments as well as many industry organizations recognize their responsibility for the health and welfare of their communities in relation to the drilling, processing & storage of Oil & Gas or applications. CLI offers a variety of materials designed and engineered for oil and gas applications. By offering custom sized panels which eliminate up to 80% of field seams we can guarantee quality and speed construction in the field. We also offer trained and certified field services crews all with the proper health and safety training required to meet your specific needs.

Supportive materials are often necessary for containment that are reliable and extremely safe for the environment. These specialty materials like GCLs, Geocomposites and Geotextiles add peace of mind and confidence to the ability of a complete system.

MOBILE WATER IMPOUNDMENTS

Colorado Lining's storage tank options are becoming a popular alternative to ground storage. Above ground storage systems are appealing for a number of reasons. These systems are designed for multiple sets and are easy to install and remove. They are highly visible, require very little excavation, leaks are quickly detected, and secondary containment is often less complicated. CLI's panel fabrication and production is done in our climate controlled factories providing high quality certified seams that save both time and money in the field. CLI recommends the use of reinforced lining materials for this application. With vertical wall applications such as the mobile water impoundments the reinforcing scrim adds tremendous strength and durability to the wall sections of each panel.

SECONDARY CONTAINMENT

Colorado Lining recognizes the importance and necessity of regulation for environmental safety specific to this trade. Secondary and spill containment is critical for oil and gas. CLI has a trusted reputation with geomembrane systems for secondary containment, but is evolving with the industry and is now offering its Ecodur Spray On Liner as an alternative to geomembranes. It is VOC & Solvent Free making it an even better choice for the environment. It is easily installed and cures and dries quickly. It too can be specified and designed as part of a multilayer system to meet specific regulation.

FLOATING COVERS

With the protection of ground, water and land elements, comes the thought and requirement for protection of wildlife and against air and odor pollutants. With one of the best Technical groups in the market CLI has been able to offer innovative solutions to the floating cover market in the Oil and Gas Industry. CLI has utilized its experience in gas collecting systems for agriculture to provide cost effective cover systems that are designed and engineered for the long term in tough Oil and Gas applications.

CLI has utilized its experience in gas collecting systems for agriculture to provide cost effective cover systems that are designed and engineered for the long term in tough Oil and Gas applications.

A BELIEF IN SUPERIOR TRAINING & CERTIFICATION

CLI credits an experienced, dedicated and well trained team with its success. CLI adheres to Safeland USA, ISNetworld & PEC Premiere Standards. Their in house Quality Control programs for factory and field seam testing follow strict ASTM Standards that meet or exceed all industry standards. Colorado Lining is an IAGI Approved Installation Contractor and is dedicated to training and certifying its welding technicians through the Certified Welding Technician Program.

Ever changing government requirements and environmental issues have led to the need for new and innovative containment solutions around the world and especially in the shale, oil and gas industries. Colorado Lining has become highly specialized in this field, with a sound understanding of the geomembrane industry, providing its customers with a consistent and expanding knowledge base, expert technical support and design information to ensure an economical, quality solution to all containment needs and challenges.
